Do your toenails appear yellow, brittle or thickened?

Then perhaps you suffer from an infection, a condition called nail fungus. Nail Fungus can be caused by heavy foot perspiration, poor shoe/sock ventilation, or walking barefoot in damp areas such as a gym or locker room. Until now, the only solutions for nail fungus were to surgically remove the nail; apply topical treatments, which have a poor success rate; or more recently, prescription medications, which have many potentially dangerous side effects.

Today, lasers are the latest treatment for nail fungus.

The Light Age Q-Clear laser treatment can effectively rid your toenails of unsightliness in as little as one or two treatments, depending on the severity of the condition. The mid-infrared laser wavelength penetrates the nail, eliminating the destructive infections and revitalizing your nail as it grows out.

What to expect...

Your toenails will be cleaned and filed prior to the laser treatment. As each toe is treated with the laser you will feel a mild, warming sensation. The laser treatment will take under 10 minutes to treat both feet and there is usually no discomfort after the treatment. The physician will discuss post-treatment care to avoid fungal re-infection.

You will notice results within 2-4 months, depending on how quickly your toenails grow. New, clear growth begins to appear at the bottom portion of your nail as the diseased portion of the nail grows out.

You may return to your normal daily routine immediately after your toenail treatment, including painting your nails or pedicure treatments.

Why choose the Q-Clear laser treatment to treat your nail fungus?

Q-Clear is an effective, quick treatment, that provides results. Light Age, the manufacturer of the Q-Clear laser, is a pioneer in the laser industry with over 25 years experience in the aesthetic and surgical medical device industry.

The Q-Clear™ Laser System is indicated for use for the temporary clearance of clear nail in patients with onychomycosis (e.g., dermatophytes Trichophyton rubrum and T. mentagrophytes, and/or yeasts Candida albicans, etc.)
